Real-Time Polyphonic Pitch Detection on Acoustic Musical Signals

Tom Goodman

University of Birmingham

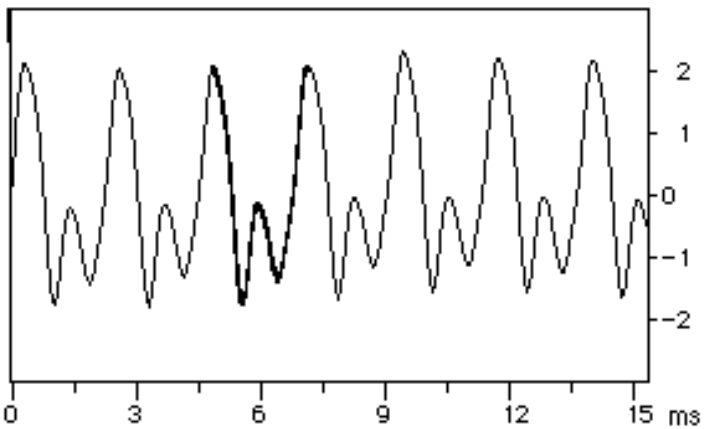
7^{th} December 2018

18^{th} IEEE International Symposium on Signal Processing and Information Technology, ISSPIT 2018

Aim

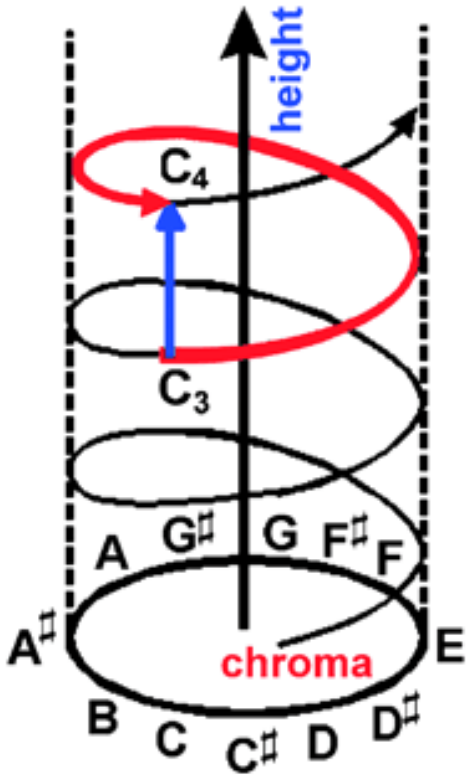
Take in an acoustic musical signal, and output the notes present.

Aim



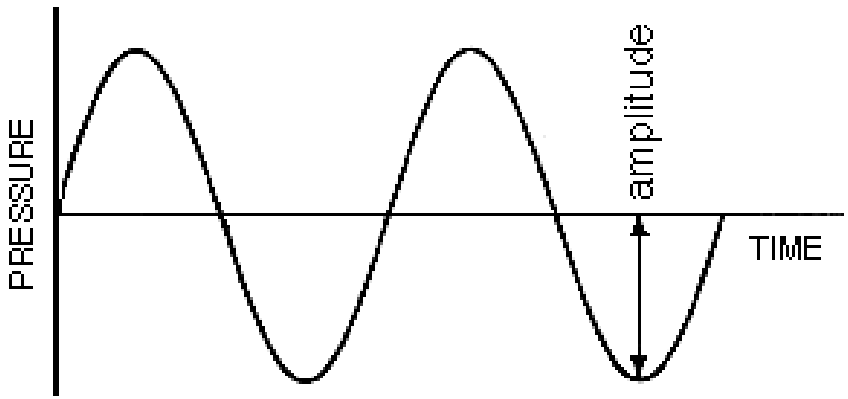
A4

Categorising Notes

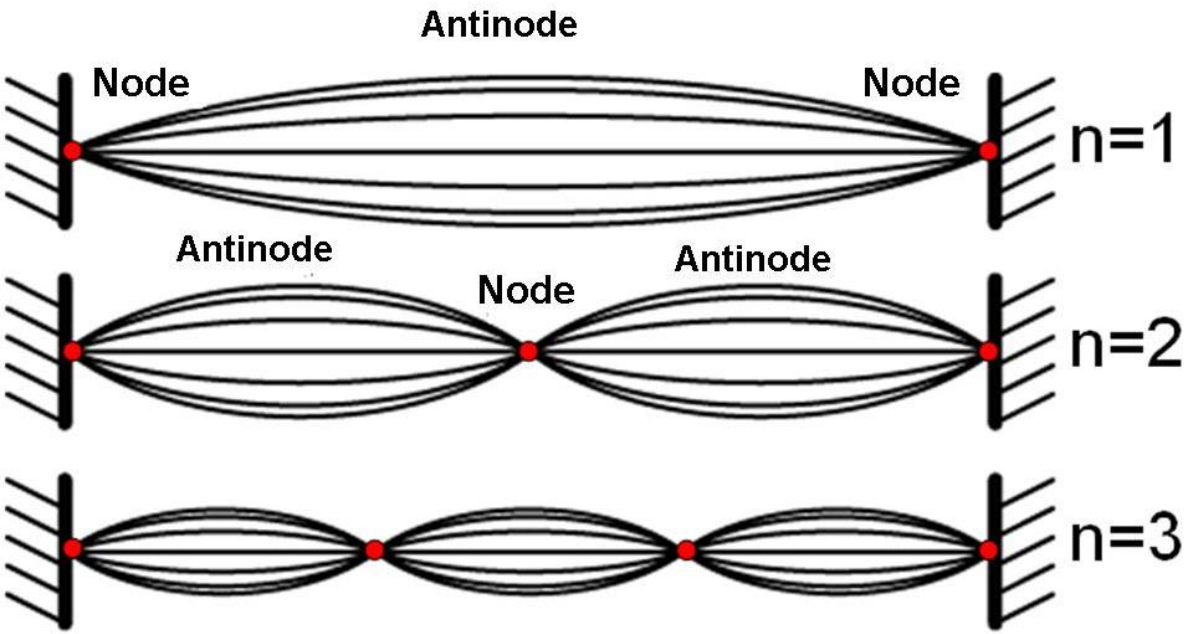


Categorising Notes

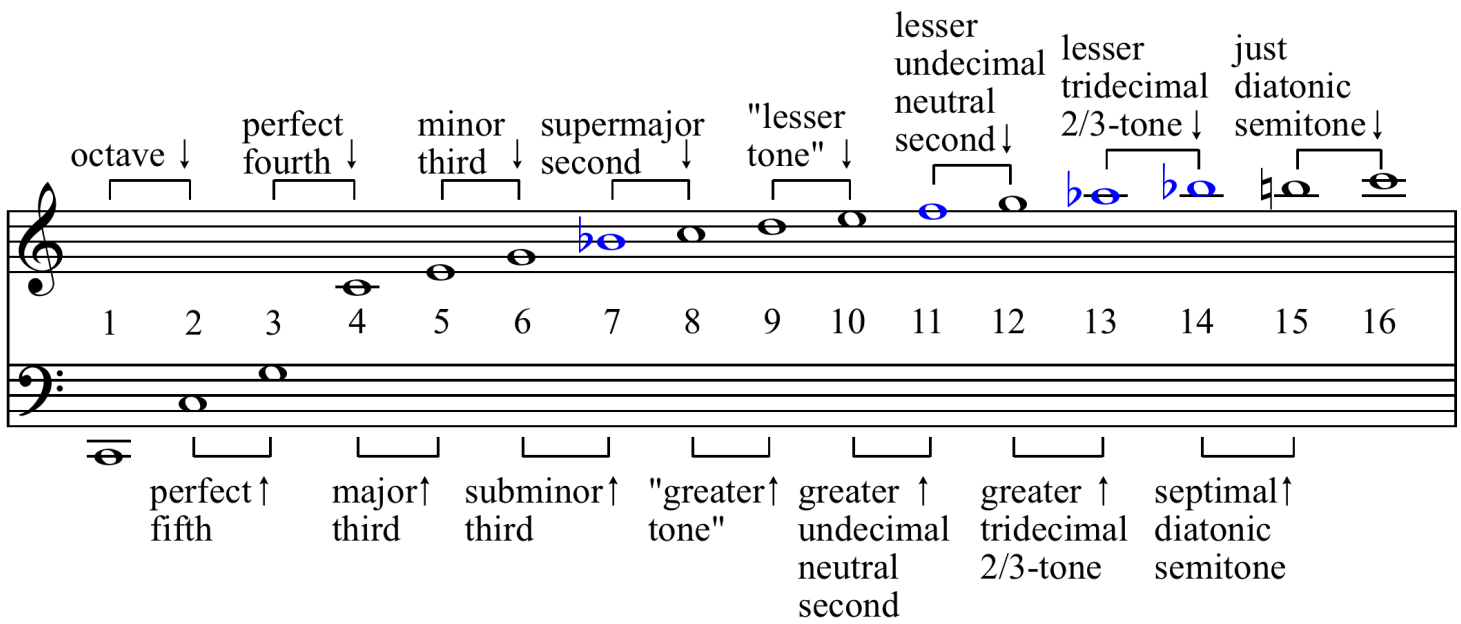
Musical Notes



Standing Waves

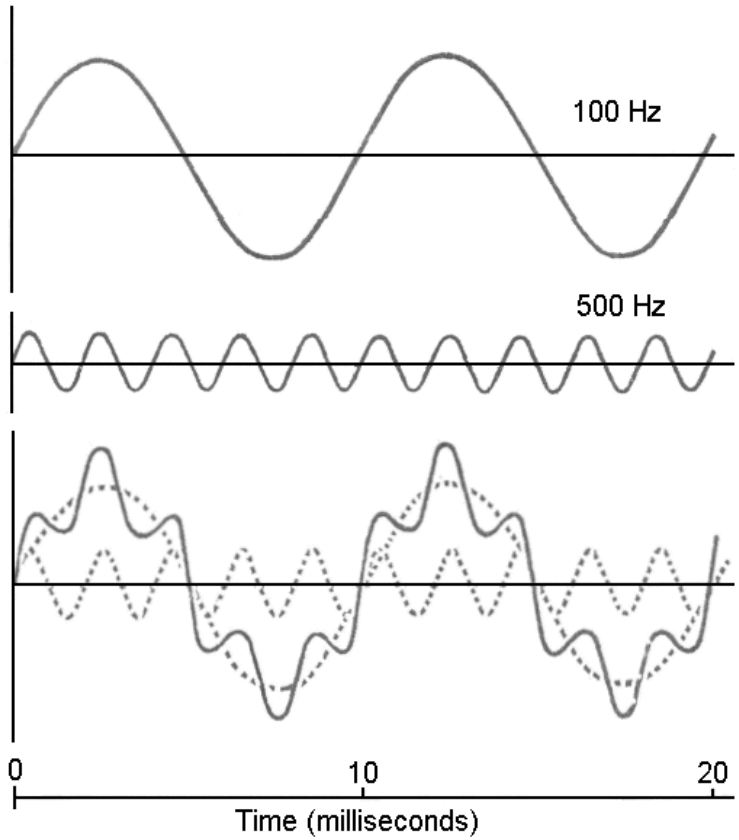


Harmonics

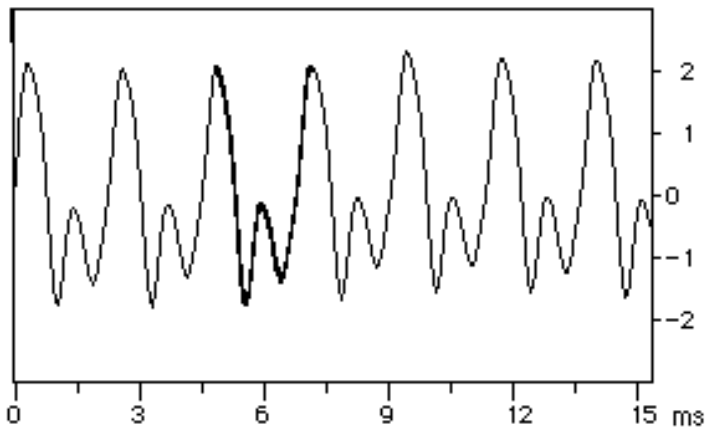


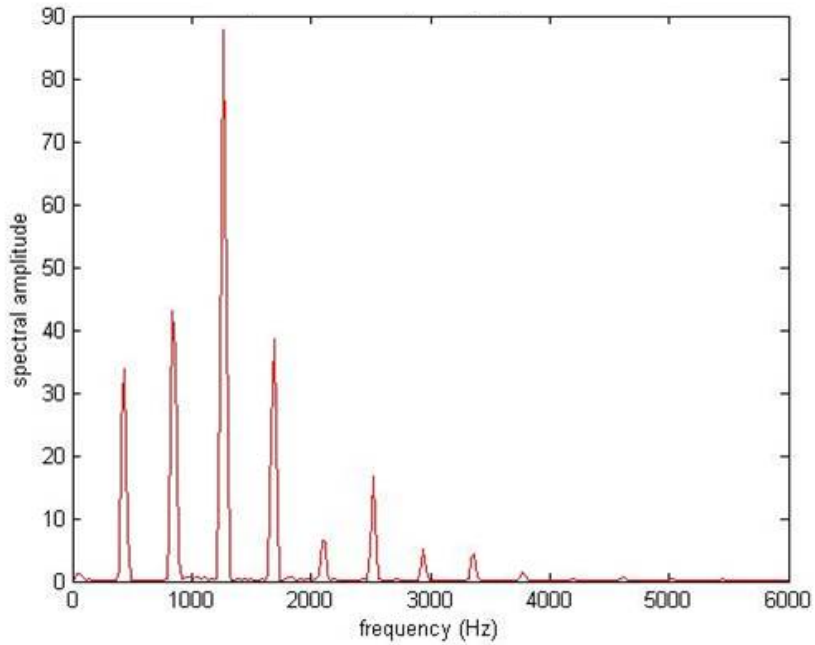
octave ↓
perfect fourth ↓
minor third ↓
supermajor second ↓
"lesser tone" ↓
lesser undecimal neutral second ↓
lesser tridecimal 2/3-tone ↓
just diatonic semitone ↓
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16
perfect ↑ fifth
major ↑ third
subminor ↑ third
"greater ↑ tone"
greater ↑ undecimal neutral second
greater ↑ tridecimal 2/3-tone
septimal ↑ diatonic semitone

Implications

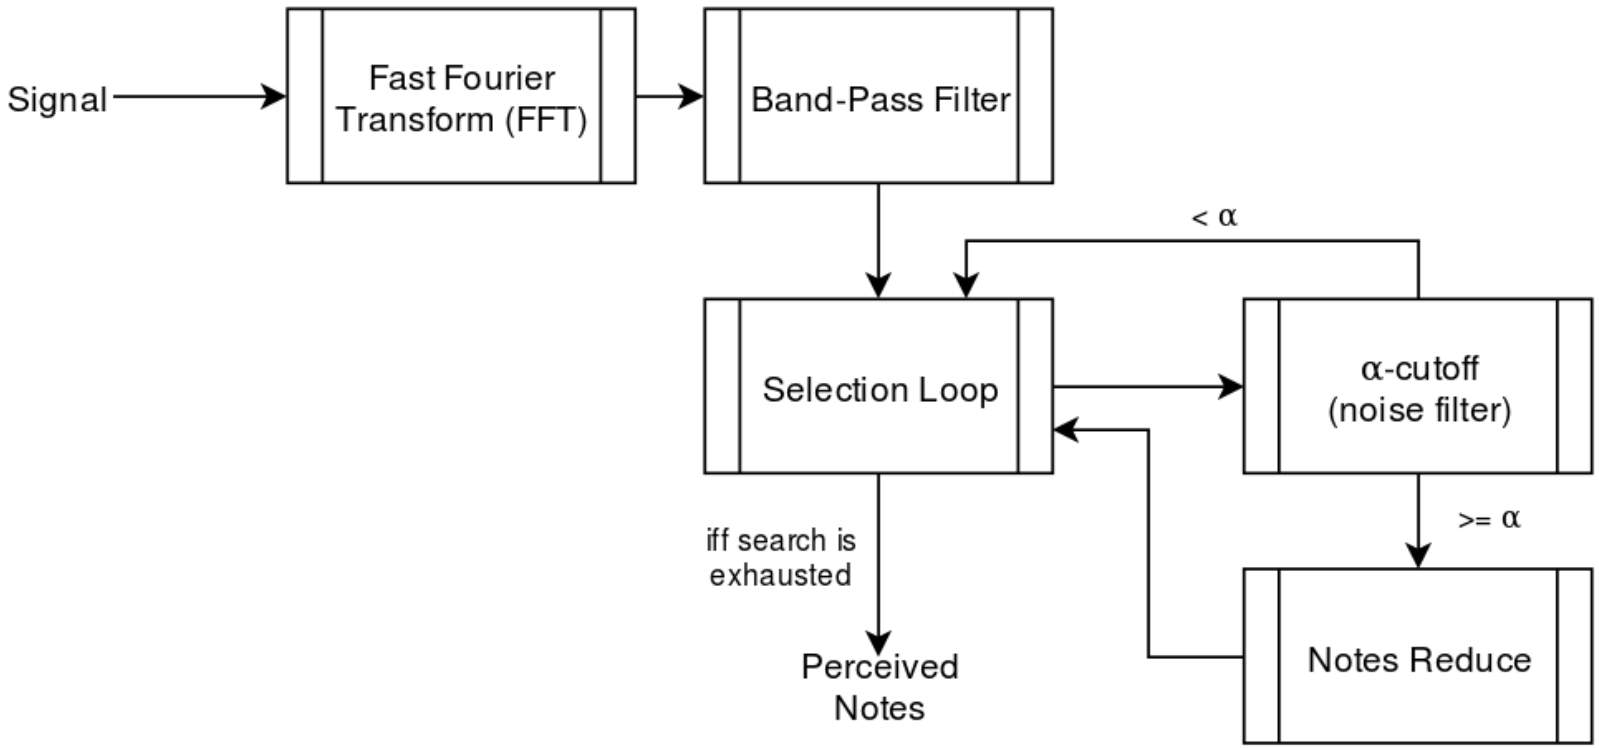


The Fourier Transform





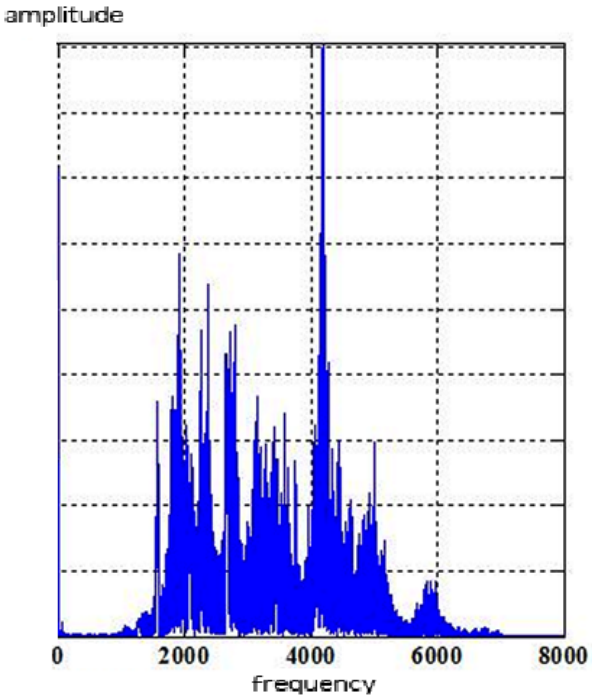
Overview



Signal
Fast Fourier Transform (FFT)
Band-Pass Filter
< α
Selection Loop
α-cutoff (noise filter)
iff search is exhausted
>= α
Perceived Notes
Notes Reduce

Assumption - No Undertones

Clustering



amplitude

frequency

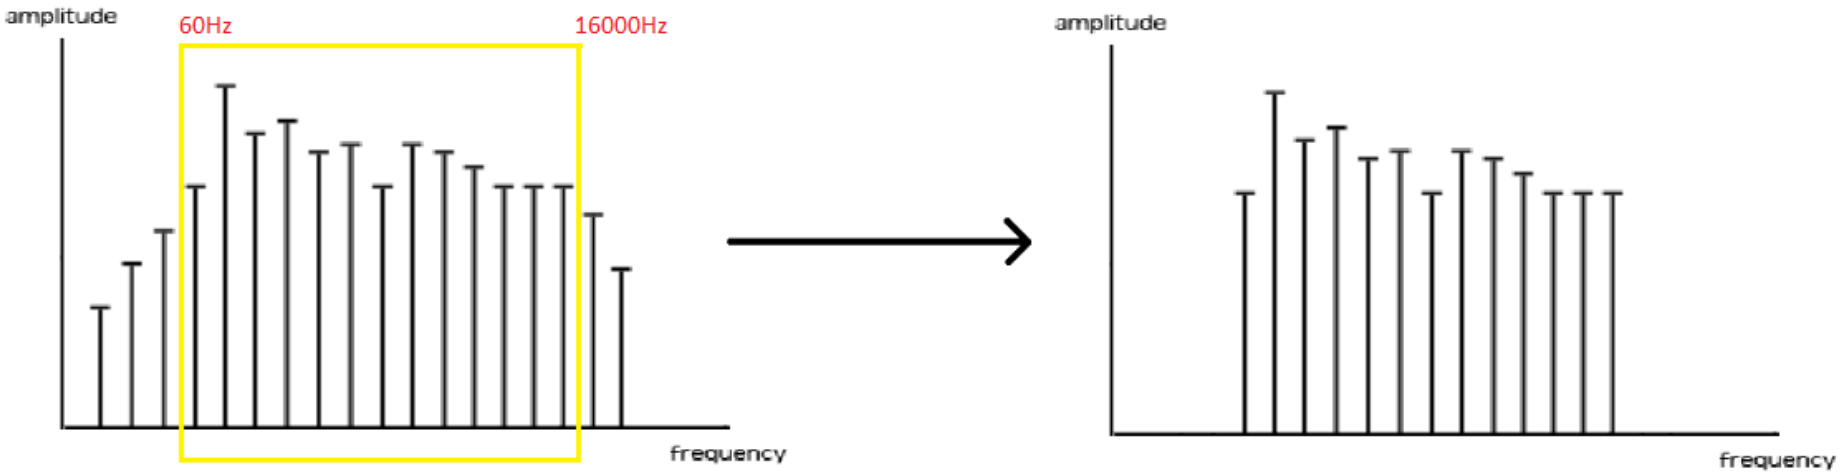
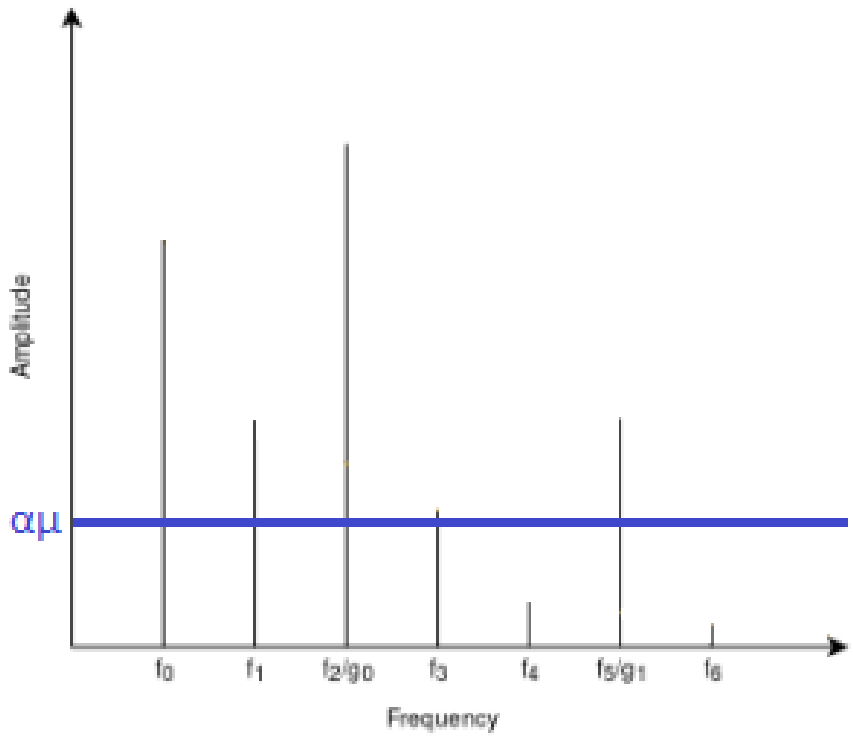
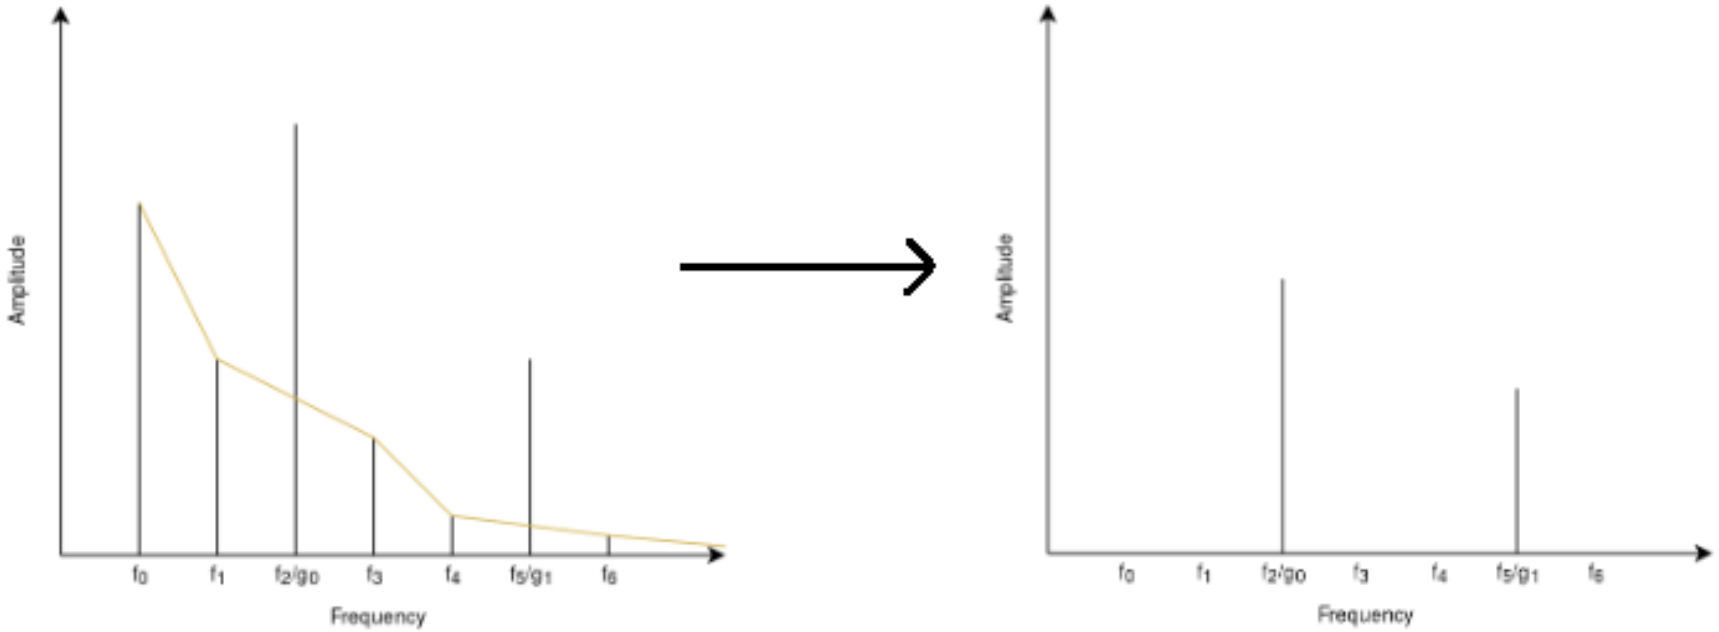
"Band-Pass" Filter



Selection Loop & α-cutoff



Notes Reduce



Testing

Results

	Precision	**Recall**	**Specificity**	**Accuracy**	**F-Score**
Test 1	78.09%	93.89%	83.00%	86.89%	84.78%
Test 2	100.00%	97.22%	100.00%	97.85%	98.55%
Test 3	82.46%	75.67%	77.52%	76.36%	78.85%
Test 4	86.31%	82.50%	53.33%	75.83%	83.47%
Test 5	65.08%	100.00%	64.29%	79.07%	78.47%
μ	82.39%	89.86%	75.63%	83.20%	84.82%

Improvements & Future Work

- Adapt evaluation to use a larger & more widely-adopted dataset (eg. MAPS)
- Adapt 'Notes Reduce' to model harmonics on an instrument-to-instrument basis
- Apply source separation to reduce polyphonic problems to multiple monophonic problems

Conclusion

- Outlined an effective method for pitch detection, in real time, on both monophonic & polyphonic signals
- Number of clear downsides to the current approach, but these can be improved upon through future research
- Solid basis for more investigation into the area
